Double Holography : Double holography is the statement that besides their description in terms of a d -dimensional BCFT or in terms of gravity in the $(d+1)$ -dimensional bulk, these setups allow a third, intermediate description: a d -dimensional CFT living on the end-of-the-world brane, coupled to d -dimensional gravity on the brane and communicating with a d -dimensional non-gravitating BCFT via transparent boundary conditions. [\[1\]](#)

Page Curve : if a black hole starts in a pure quantum state and evaporates completely by a unitary process, the von Neumann entropy of the Hawking radiation initially increases and then decreases back to zero when the black hole has disappeared.
